

These proposed cuts will damage the important fisheries around Australia's seas. Why not look at expanding the no fish zones to allow all species of fish in those areas to recover to their best levels that way fishing is sustainable. This is a completed no brainer a missed creative job opportunity. You just need to look at Iceland's management program it works and the fish are of huge numbers and big fat and juicy. The prices of Atlantic cod have been going up in price drastically over the last 10 years. Just think Australia has a great opportunity to create a much bigger export fish and crustacean market which will address the job shortages and put money in the bank. It does not need money just better management will see the industry grow and expand in a healthy sustainable way, feeding the worlds need for food in the near future. Australia has other great feats to achieve by bio engineering the area north of Adelaide. Turn on the desalination plant 24/7 use this water to irrigate more land with soil from home recycling of food scraps. The power to run the desalination plant 24/7 could be achieved by building a Solar Tower like in Spain it works and does not need expensive batteries that will need to be replaced every 5/7 years max. Solar towers are the way use the South Australian sun do the hard work feeding the steam turbines when needed, store the steam in thermal underground insulated tanks to use in peek periods. Simple just needs some effort and a little money to get the economy booming again.
