

The great barrier reef is in enough trouble with the reef dying, the last thing we need is to open slather on these precious eco systems.

The reef is the fundamental base building block for biodiversity and life in the Corel Sea. To start killing the larger fish and top predators will put the now endangered ecosystem more out of balance causing more problems which is the opposite of what is needed to try to preserve life and the ecosystem in the Corel Sea.

World wide there are up to 200 species of marine life that become extinct every day, the worlds oceans including our own iconic barrier reef is in a lot of trouble, we desperately need conservation planning not destructive planning for the future of our marine habitats.

I strongly urge you not to wind back the current conservation declared areas of ocean, marine parks, reefs etc..

Very Concerned Citizen.
